Problem statement

Every insured farmer has to prove how much grain came from each part of their farm. They prove it every spring in the yearly harvest report, and again whenever they file a claim. That proof is spread across paper receipts, different grain buyers' apps, grain sitting in storage bins, and grain fed to animals that often never gets written down. Agents spend their busiest weeks chasing these records. Missing or messy records lower the farmer's coverage and are the biggest cause of claims getting paid wrong.

The product

One app that captures every bushel as harvest happens, stores it by field, and gives the agent a finished record set.

Features

1. Receipt capture: where the grain went

- Farmer photographs a paper receipt, or links their grain buyer's app so receipts flow in automatically.
- AI reads the weight, wetness, date, buyer, and ticket number.
- Each receipt keeps its original photo as proof.

2. GPS field tagging: where the grain came from

- When a truck is loaded, the farmer taps "Loaded" and the phone's GPS records which field they're standing in.
- When the receipt comes in, the app matches it to that load by time.
- So every truckload is tied to a field. (The receipt alone can't do this, because it's printed at the buyer, not the field.)

3. Bin tracking: grain kept on the farm

- Each bin is saved once with its size.
- Before adding grain, the farmer measures the grain height and snaps a photo. The app converts that to bushels.
- It warns the farmer before grain from two field groups gets mixed in one bin.
- The adjuster confirms bin numbers rather than measuring from scratch.

4. Feeding log: grain fed to animals

- One tap: "Fed 2 loads from Bin 3 today."

- Better still, the app reminds the farmer to get the bin counted *before* feeding starts. USDA says that if the insurer determines total production before feeding starts, no daily feeding log is required**.**

5. Database: everything in one place

Table	What it holds
Farms	**Farmer, agent, policy**
Fields	**Each field group and its map location**
Loads	**Every truckload: field, GPS, time**
Receipts	**Photo, weight, wetness, buyer, linked load**
Bins	**Size, every measurement with photo and date**
Feeding log	**What was fed, from which bin, when**
Yearly reports	**Each year's harvest totals by field group**
Audit trail	**Who entered or changed what, and when**

1. Collects and organizes every receipt.

Each time a farmer sells a truckload of grain, the buyer weighs it and gives them a receipt. The farmer takes a photo of it in our app. The AI reads the receipt and pulls out the weight, date, and buyer. It then sorts each truckload by which field it came from, based on the date and the field the farmer was harvesting that day. By the end of harvest, every receipt is organized by field with running totals, and the app points out any days with missing receipts.

2. Fills out the insurance claim.

When the farmer files a claim, the AI takes the organized totals and fills in the government's claim form. It does the required math, like subtracting extra weight from wet grain. It also checks this year's totals against past years and flags anything that looks off. For large claims that need three years of records, it pulls those together automatically.
